

CC 105 CERAMIC COATING

Like no wax or sealant, CC105 provides paint protection with previously unachievable levels of gloss, durability scratch and chemical resistance.

CC105 is applied to car paint, plastic trim and bumpers with an easy one-step application ensuring up to five years of durable nano ceramic protection. It's unique composite technology enables you to achieve a thick two layer coating with one easy application.

CC105 has composite matrix which means the hard 9H top and softer base layer give you scratch resistance from spider web marring and swirl marks that are caused by improper car care.

Test prove its hard top coat and flexible base layer actively reduce wash swirls, which keeps your vehicle looking new for a longer period of time.

The greatest attribute of CC105 is the ease of maintenance it provides. When CC105 is applied, the nano composite structure forms a super slick hydrophobic surface. Having a hydrophobic surface allows dirt to slide off the paint, brake dust will not stick to the wheels and your vehicle will stay cleaner longer. Having a hydrophobic surface will allow your automobile to self clean when you drive through rain. The water easily removes dirt from the surface of your vehicle by encapsulating it and then rolling off the surface.

No other car wax or sealant offers this ease of maintenance and self cleaning effect.

PROTECTION

CC105 nano particles fill the smallest pores and crevices in the clear coat, which makes it extremely slick and hydrophobic.

This dramatically lowers the surface tension, preventing environmental contaminants such as bird droppings, bugs, dirt, tar and graffiti paint from sticking to the clear coat.

WEATHER

On hot summer days, carnauba waxes melt away and sealants break down.

This leaves your clear coat exposed to the harsh sun and environmental contaminants. However, CC105 is unaffected by extreme heat, even up to 350 F.

This offers you exceptional UV protection which prevents premature dulling and loss of gloss.
